Agenda

Project "Autonomous Ropeway System"

Challenges in the project

Azure Arc integration

Further Azure Arc features

Project “Autonomous Ropeway System”

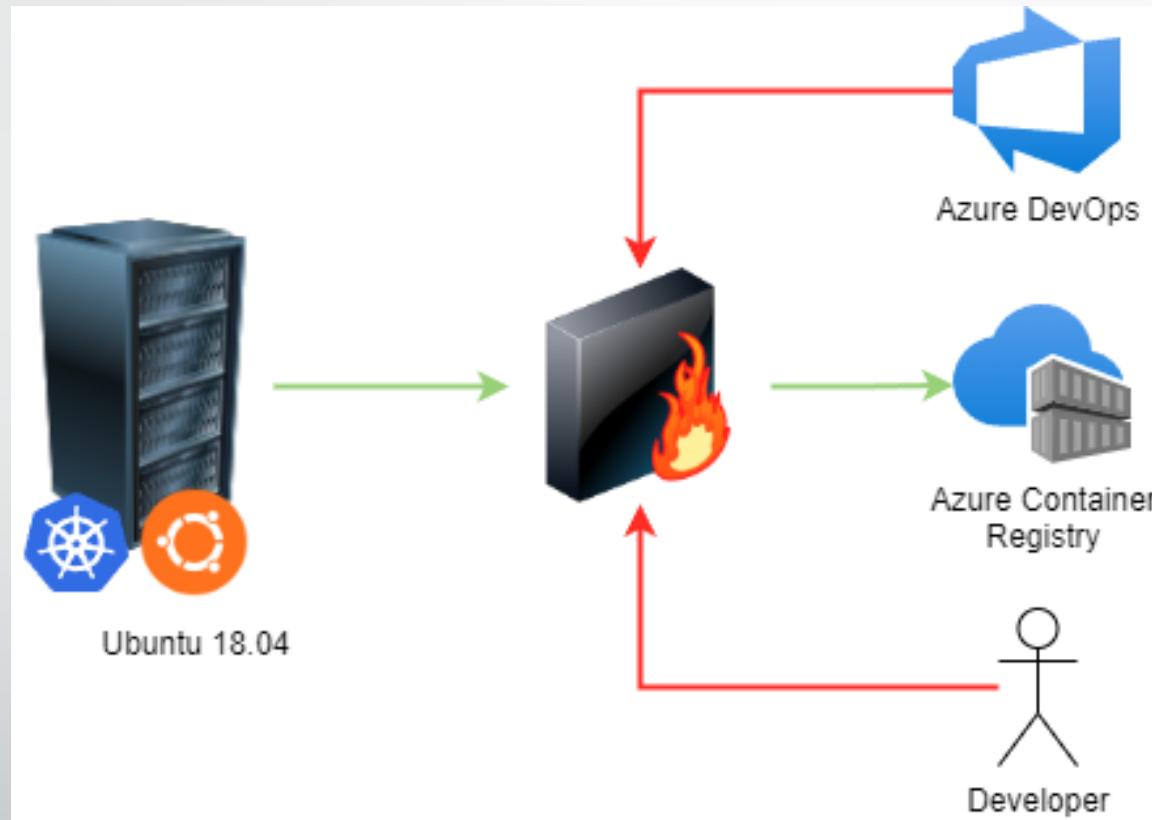

- Ropeway vehicle comes out of the garage automatically
- Routing possible → ropeway vehicle can find its way
- Saves costs due to better usage of resources and less wear and tear
- Running 24/7 with minimum human interaction

Challenges

- Use existing hardware
- No inbound traffic allowed
 - No connection from Azure DevOps
 - How can developers access the Kubernetes cluster?
 - How to collect logs from the cluster?
 - No VPN or ExpressRoute allowed

Network Overview

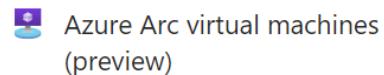

Azure Arc

Azure Arc Overview

- Project infrastructure running outside of Azure into Azure
 - Linux and Windows VMs and bare metal servers
 - Any CNCF certified Kubernetes distribution
 - MS SQL Server

See and manage all your on-prem infrastructure, anywhere. It's free to get started.

With Azure Arc, you can manage your infrastructure in all your environments, including on-premises, other public clouds, and edge devices. There's no charge to start, just add your infrastructure and enjoy the views. [Learn more](#)

Get hands-on with ArcBox

Use ArcBox to deploy an Azure Arc sandbox in less than an hour. [Learn more](#)

[Try ArcBox](#)

Add your infrastructure for free

See all your infrastructure in Azure. There's no charge to add and view your existing resources. [Learn more](#)

[Add](#)

Deploy Azure services

Use Azure Arc to deploy Azure services on your infrastructure. [Learn more](#)

Azure Arc Overview

- Project infrastructure running outside of Azure into Azure
 - Linux and Windows VMs and bare metal servers
 - Any CNCF certified Kubernetes distribution
 - SQL Server
- Manage infrastructure as it was running in Azure
 - Update Management
 - Configuration Management
 - Microsoft Cloud Defender

Azure Arc-enabled Kubernetes

- Install Azure Arc extensions to manage the cluster
 - Azure Monitor
 - GitOps with Flux
 - Azure Policy
 - Azure Key Vault Secrets Provider
- Securely access cluster without opening inbound ports

Proof of Concept

Proof of Concept

- K3s
- Lightweight, open-source CNCF certified Kubernetes
- Developed and maintained by Rancher
- `curl -sfL https://get.k3s.io | sh -`

Azure Arc Installation Prerequisites

- Azure CLI
- Azure CLI Arc extension

Azure Arc Installation

- Install with Azure CLI on Master node of k3s cluster

```
root@Office:/home/wolfgang# az connectedk8s connect --name k3s-arc --resource-group ArcDemo  
This operation might take a while...
```

Azure Arc Installation

- Install with Azure CLI on Master node of k3s cluster

```
root@Office:/home/wolfgang# az connectedk8s list --resource-group ArcDemo --output table
Name      Location     ResourceGroup
-----  -----
k3s-arc    westeurope   ArcDemo
```

Azure Arc Installation

- Install with Azure CLI on Master node of k3s cluster
- Applications are installed in the azure-arc namespace

Azure Arc Applications

```
PS C:\Users\Wolfgang> kubectl get pods -n azure-arc
```

NAME	READY	STATUS	RESTARTS	AGE

Securely Access Cluster through Azure Arc

- Use K8s RBAC or Azure RBAC
- Generate access token
- Use token in Azure Portal
- Create proxy with token on developers machine

Access Cluster using K8s RBAC

- Create a new service account

```
root@Office:/home/wolfgang × + ▾  
root@Office:/home/wolfgang# kubectl create serviceaccount admin-user  
serviceaccount/admin-user created
```

Access Cluster using K8s RBAC

- Create a new service account
- Add desired role for the user

```
root@Office:/home/wolfgang × + ▾
root@Office:/home/wolfgang# kubectl create clusterrolebinding admin-user-binding \
>   --clusterrole cluster-admin \
>   --serviceaccount default:admin-user
clusterrolebinding.rbac.authorization.k8s.io/admin-user-binding created
```

Access Cluster using K8s RBAC

- Create a new service account
- Add desired role for the user
- Create access token

Access Cluster using K8s RBAC

```
root@Office:/home/wolfgang ~ + -> root@Office:/home/wolfgang# kubectl create token admin-user

Azure Arc extensions

- Bring Azure Services to your Kubernetes cluster
 - GitOps for deployments
 - Azure Monitor
 - Azure Key Vault Secrets Provider

Azure Arc-enabled Kubernetes GitOps

- Flux GitOps Agent runs inside the cluster
- Can be installed via Azure CLI or Azure Portal
- Agent pulls changes from a configured repository and applies them
 - YAML files
 - Helm charts
- Securely access private Git repositories
No inbound connection needed

GitOps Deployment

```
PS C:\Users\Wolfgang> kubectl get pods -n azurearcdemo
NAME                      READY   STATUS    RESTARTS   AGE
azurearcdemo-64fb7fcfc-4v6qr   1/1     Running   0          28m
```

GitOps Repository

- Kustomize file referencing all release files

GitOps Repository

```
apiVersion: kustomize.config.k8s.io/v1
kind: Kustomization
resources:
- HelmRelease.yaml
```

GitOps Repository

- Kustomize file referencing all release files
- YAML file containing information about the Helm chart

```
apiVersion: helm.toolkit.fluxcd.io/v2beta1
kind: HelmRelease
metadata:
  name: azurearcdemo
  namespace: azurearcdemo
  annotations:
    | clusterconfig.azure.com/use-managed-source: "true"
spec:
  interval: 1m
  releaseName: azurearcdemo
  chart:
    spec:
      | chart: ./AzureArcDemo/charts/azurearcdemo
```

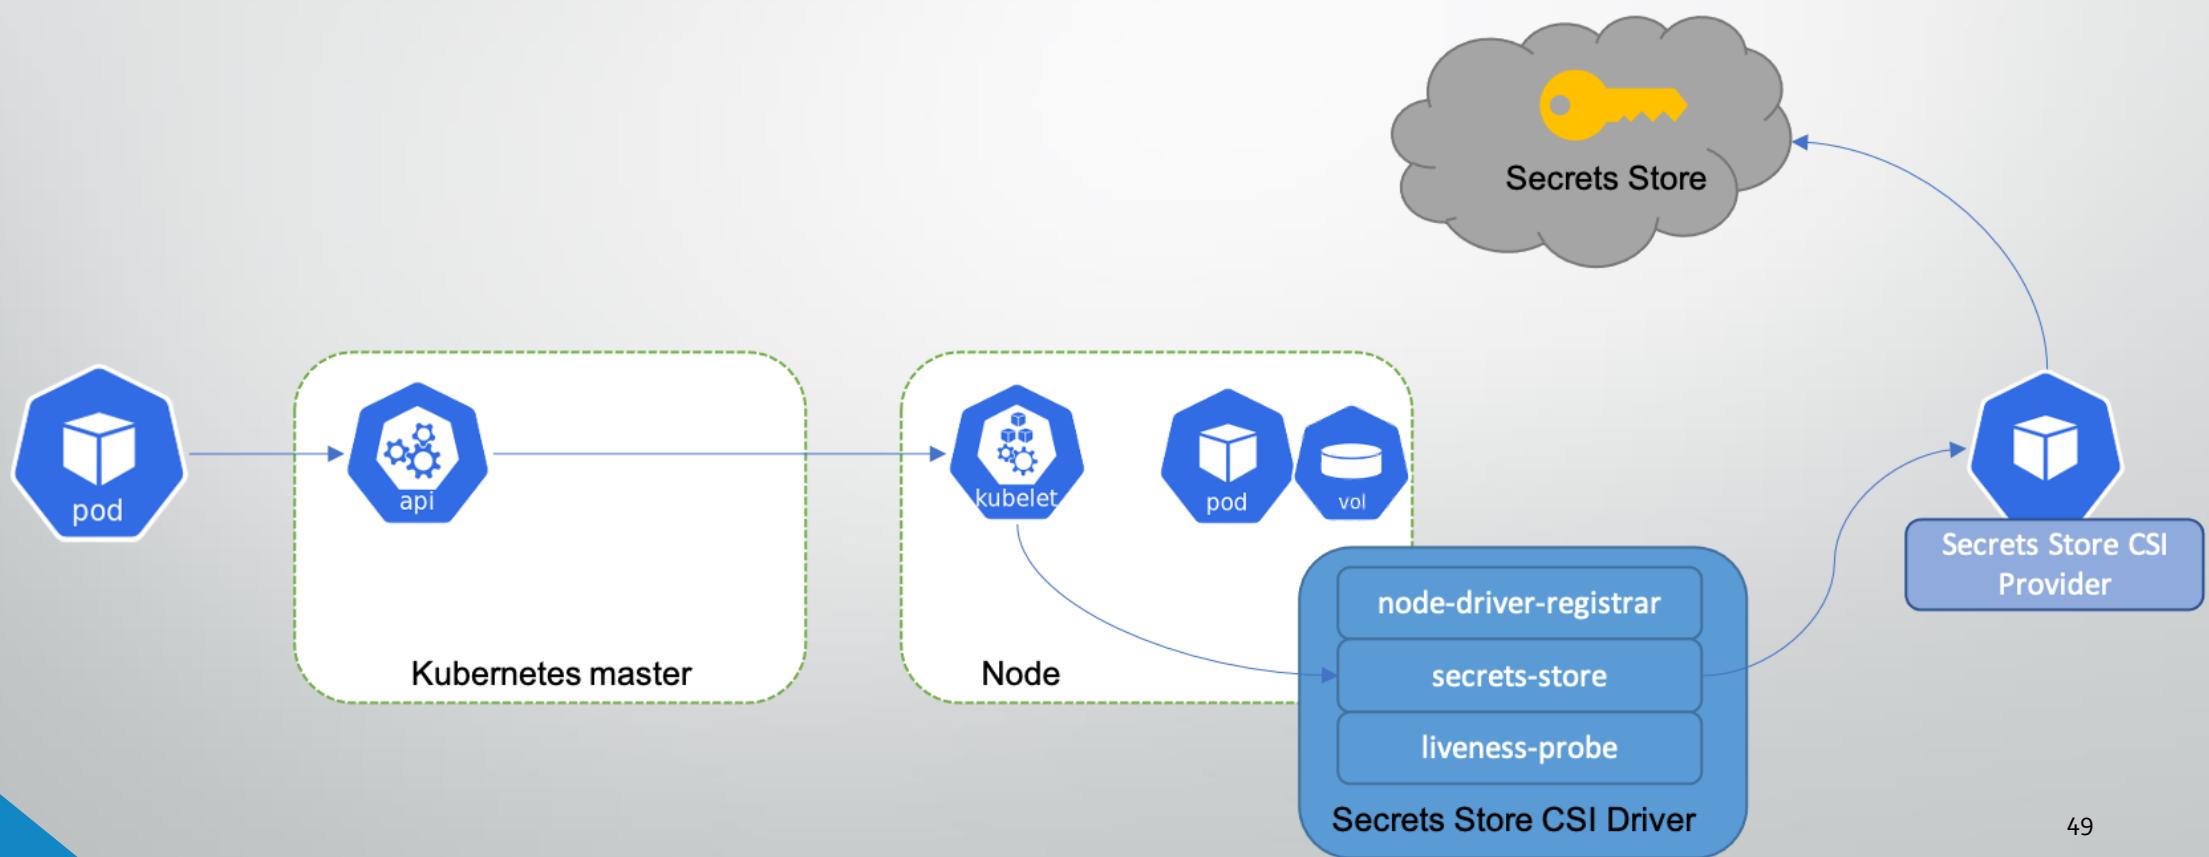

GitOps Pipeline

- CD Pipeline reads newest tag from Azure Container Registry
- Replace tag in values.yaml file
- Commit changes to master branch
- GitOps Agent sees changes and applies them to the k3s cluster

Key Vault Extension

- Mount secrets from Azure Key Vault into Kubernetes
- Secrets are retrieved using gRPC
- Get all advantages from Azure Key Vault
- Use pipeline to write/rotate secrets in Key Vault

Key Vault Extension

Azure Monitor Extension

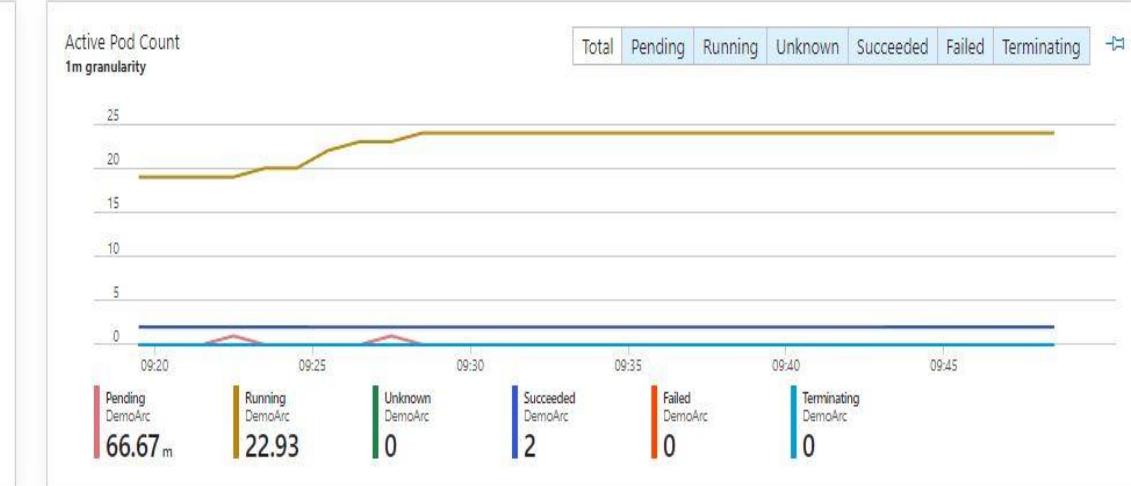

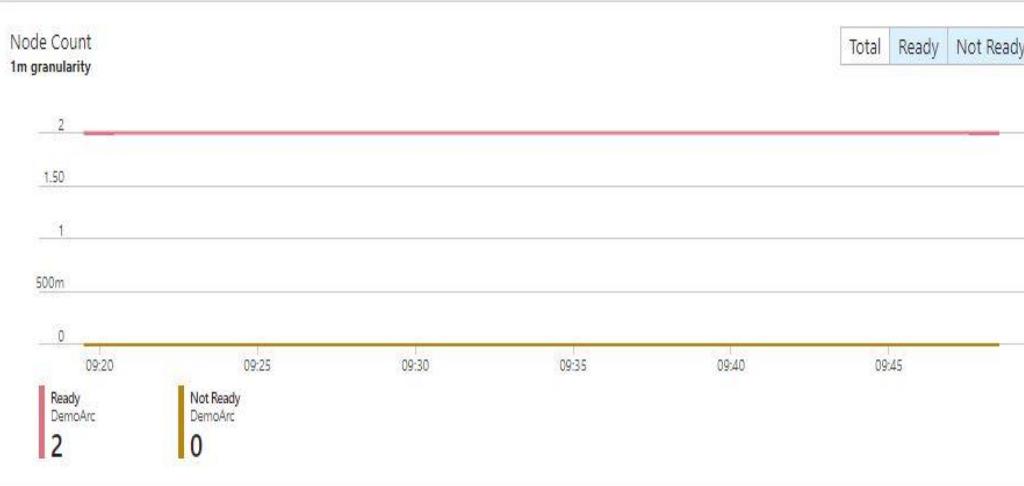

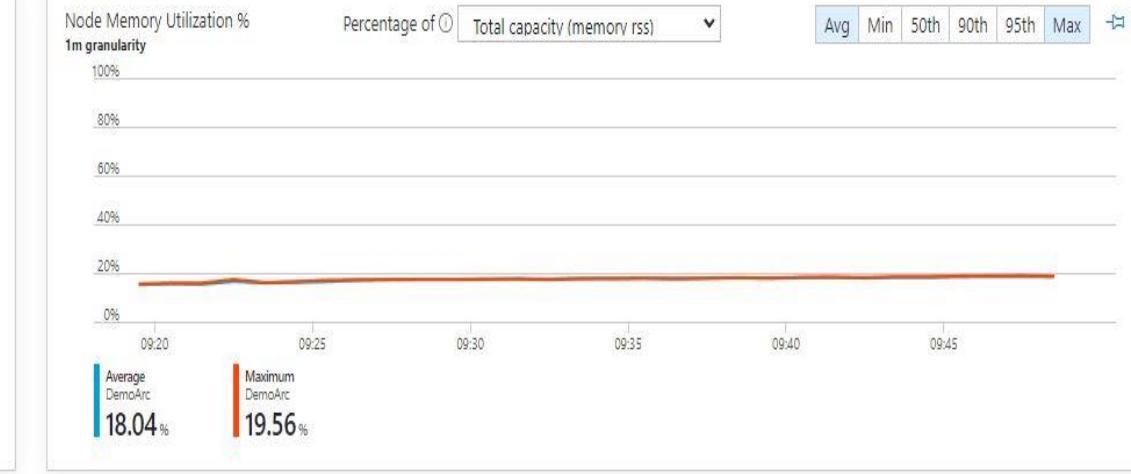

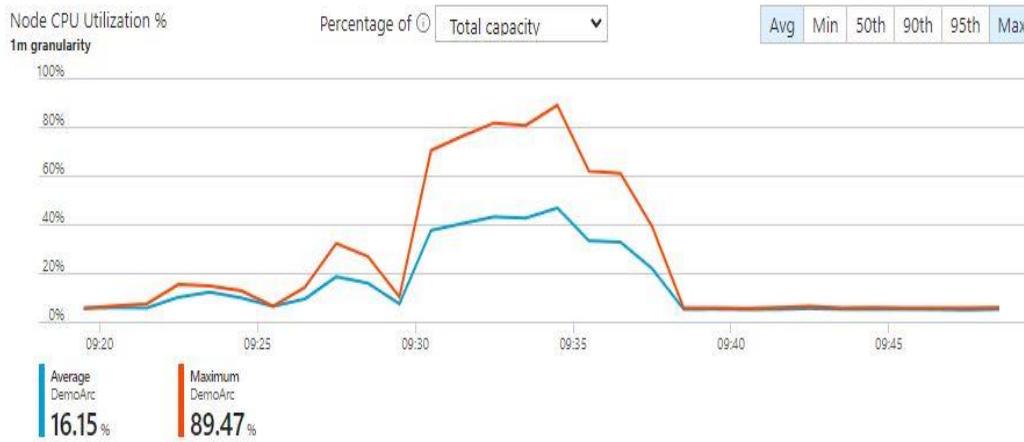

- Azure Monitor agent is installed in its own namespace
- Agent sends information to Log Analytics Workspace
- Azure Monitor:
 - Dashboards
 - Alerting
 - Container Insights

Azure Managed SQL Instance

- Works on any hardware and Kubernetes distribution
- Service runs in its own namespace
- Install via Azure CLI or Azure Portal

```
root@Office:/home/wolfgang# az sql mi-arc create --name arc-database --dev --k8s-namespace wolfgang-attic --use-k8s
Arc SQL managed instance username:wolfgang
Arc SQL managed instance password:
Confirm Arc SQL managed instance password:
arc-database is Ready
```

Azure Managed SQL Instance

- Works on any hardware and Kubernetes distribution
- Service runs in its own namespace
- Install via Azure CLI or Azure Portal
- Keep your data on-premises
- Only metadata for billing purposes is sent to Azure

Azure Arc Conclusion

- Proof of concept was successful
- Powerful service
- Major focus from Microsoft

- Broad IT-knowledge needed
- Service can be buggy
- Documentation sometimes complicated
