Agenda

- Architecture in SW projects
- Introduction to KEDA
- Scaling with messages in Azure Service Bus Queue
- Scaling Azure DevOps Agents in Kubernetes
- KEDA Conclusion
- Q&A

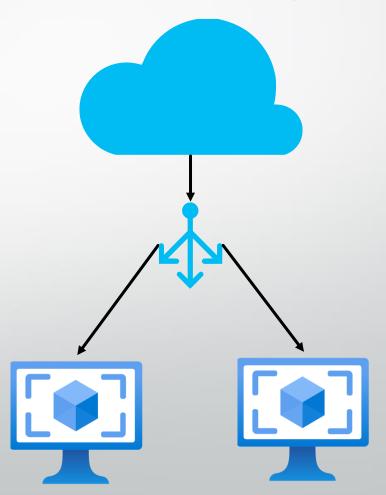

Simplified Architecture History

- Server Client Architecture
- Only few clients
- No redundancy
- No high availability

Simplified Architecture History

- Static load balancing
- New VMs need to be added by hand
- Expensive on-premises hardware

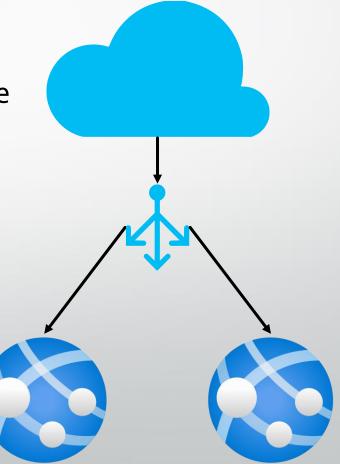

Simplified Architecture History

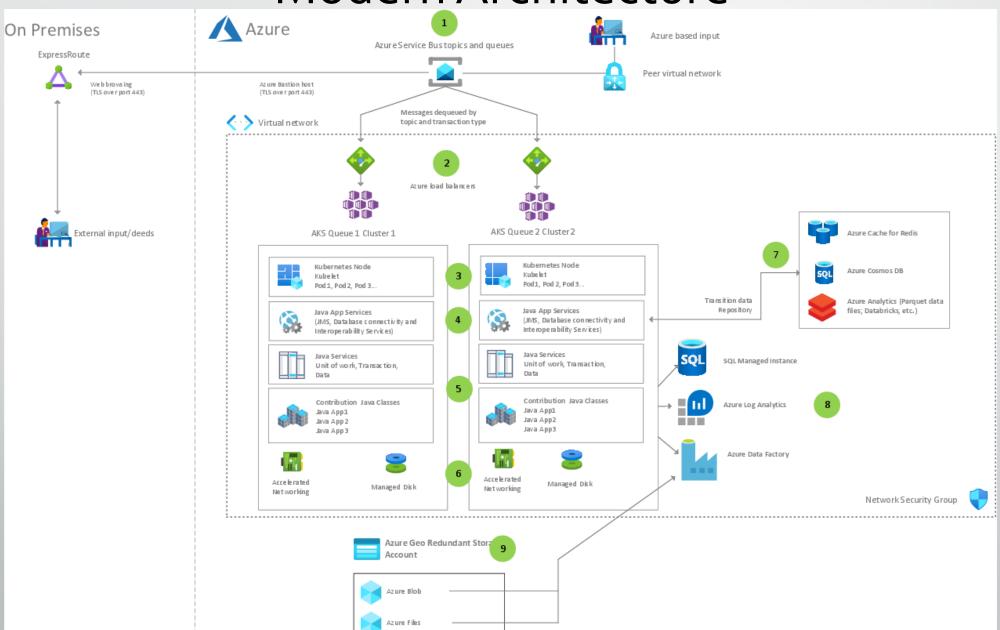

Automatically adding additional hardware

Pay only what you need

Mostly CPU or RAM based scaling

Modern Architecture

Kubernetes

- Horizontal Pod Autoscaler (HPA)
 - Scaling according to CPU and/or RAM
- Architectures get more and more complex
- Dependencies on external components
- Applications have to react to events
 - Database
 - Service Bus
 - Streams

Horizontal Pod Autoscaler

- Scales Deployments or StatefulSets
- Adds or removes pods
- Scaling based on CPU or RAM usage
- Scaling on custom metrics
 - Query custom metrics from Kubernetes API
 - Prometheus
 - requests per second

Horizontal Pod Autoscaler Configuration

```
apiVersion: autoscaling/v1
kind: HorizontalPodAutoscaler
metadata
 name customerapi
 namespace: customerapi-test
spec
 maxReplicas: 10
 minReplicas 1
  averageCpuUtilization: 50
  scaleTargetRef
    apiVersion apps/v1
    kind Deployment
    name customerapi
```

```
behavior:
  scaleDown:
    policies:
    - type: Pods
      value: 4
      periodSeconds: 60
    - type: Percent
      value: 10
      periodSeconds: 60
    selectPolicy: Min
```

```
policies:
  policies:
  type: Pods
  value: 5
  periodSeconds: 60
  type: Percent
  value: 12
  periodSeconds: 60
  selectPolicy: Max
```

Limitation of the HPA

- Black Friday
- Thousands of orders are stored in a queue
- Scaling using CPU or RAM is not sufficient
- No option for scaling in this scenario

KEDA – Kubernetes Event-driven Autoscaling

- Kubernetes Event-driven Autoscaling
- Open source
- CNCF Project
- Maintained by
 - Docplanner Tech
 - Microsoft
 - Red Hat

KEDA

- 62 built-in Scaler
 - Apache Kafka
 - Azure Blob Storage
 - Azure Monitor
 - Azure Service Bus
 - Elastic Search
 - MongoDB
 - Prometheus
 - Redis Streams

KEDA Use Cases

- Scale according to external events
- Scale to Zero
 - Bring serverless to your datacenter
 - Recreate Azure Functions architecture
 - Better resource usage

KEDA Installation

- Installation via Helm charts
- Namespace: keda

KEDA Installation

kubectl create namespace keda

helm repo add kedacore https://kedacore.github.io/charts

helm repo update

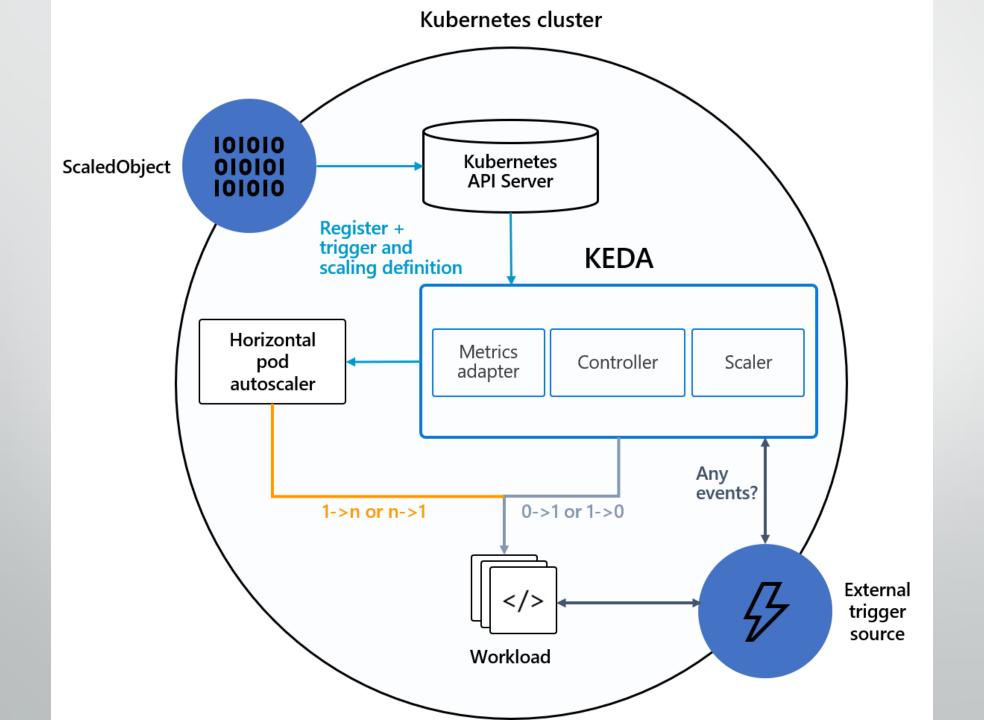

helm install keda kedacore/keda --namespace keda

KEDA Resources

PS C:\Users\Wolfgang> kubectl get all -n	keda	DEA	DV STATI	IC DESTAN	TC AC	<u>.</u>

KEDA Architecture

- 2 components for KEDA
 - Agent or Operator
 - Metrics Server
- Uses HPA for scaling
- Seamless integration into existing architecture

KEDA Architecture

- 2 components for KEDA
 - Agent
 - Metrics Server
- Uses HPA for scaling
- Seamless integration into existing architecture
- 2 custom K8s resources for scaler
 - ScaledObject
 - TriggerAuthentication

ScaledObject

```
apiVersion:
keda.sh/v1alpha1
kind: ScaledObject
metadata:
   name: kedademoapi-scaler
```

```
spec:
    scaleTargetRef:
    name: kedademoapi
    minReplicaCount: 0
    maxReplicaCount: 10
    pollingInterval: 30
    cooldownPeriod: 30
```

```
triggers:
    type: azure-servicebus
    metadata:
        queueName: KedaDemo
        queueLength: '5'
        authenticationRef:
        name: trigger-
authentication-kedademoapi
```

TriggerAuthentication

```
apiVersion: keda.sh/v1alpha1
kind: TriggerAuthentication
metadata:
   name: trigger-authentication-kedademoapi
spec:
   secretTargetRef:
    parameter: connection
        name kedademoapi-connectionstrings
        key: AzureServiceBus__ConnectionString
```

Kubernetes Secret

```
PS C:\Users\Wolfgang> kubectl get secrets
NAME
                                                      TYPE

Azure DevOps Limitations

- ADO Pipelines support scale to zero but need at least one agent registered
- ADO Pipelines can not queue a job with an empty agent pool
- Licensing limits parallel jobs

KEDA ADO Scaling Limitations

- Cancelling a pipeline does not stop running pods
- KEDA does not remove completed pods
- Azure DevOps does not remove offline agents from the agent pool

KEDA in Production

- Microsoft uses KEDA for Azure Services
 - Azure Container Apps
 - Azure App Services with Azure Arc
- KEDA 1.0.0 → 17. Nov 2019
- Currently 2.10
- Over 6k GitHub stars
